#### Description
- **Pressure Ulcer Stage 4 – Knee**: Partial to full-thickness wound with slough/fibrin
- **Pressure Ulcer Unstageable – Hip**: Wound with eschar/dried necrosis
- **Diabetic Foot Ulcer Burn Non-progressing**: Full thickness wound with slough; signs of surgical removal of callus on margin
- **Burn**: Deep, partial-thickness burn with white eschar
- **Non-progressing Venous Leg Ulcer**: Non-progressing wound

#### Drainage
- Minimal to heavy
- None
- Low to moderate
- Minimal to heavy
- None to heavy

#### Clinical Action
- Active, selective debridement

#### Treatment Goal
- Clean, granulating wound bed

---

**Measurement and Application Protocol**

1. **CLEANSE**: Gently cleanse the wound bed with sterile saline or an appropriate wound cleanser (optimal pH 6–8) followed by saline, each time a dressing is changed.

2. **APPLY**: Apply SANTYL® Ointment at 2 mm thickness (approximately nickel thickness) within the area of the wound. Apply SANTYL® Ointment once daily (or more frequently if the dressing becomes soiled, as from incontinence).

3. **COVER**: Remove as much loose debris from the wound as possible, if infection develops:
   - You may apply a topical antibiotic powder before applying SANTYL® Ointment
   - If infection persists, discontinue use of SANTYL® Ointment until the infection is resolved.

---

Collagenase SANTYL® Ointment is indicated for debriding chronic dermal ulcers and severely burned areas. Occasional slight transient erythema has been noted in surrounding tissue when applied outside the wound. One case of systemic hypersensitivity has been reported after 1 year of treatment with collagenase and cortisone. Use of Collagenase SANTYL® Ointment should be terminated when debridement is complete and granulation tissue is well established.

Please see accompanying complete prescribing information for more details.

Measurement and Application Protocol for Collagenase SANTYL® Ointment

The images below are provided as a reference and are not intended to supersede independent clinical judgment or institutional protocols.

20-g tube: 3.04 cm (1.20 in) = approximately 1 g
90-g tube: 1.78 cm (0.70 in) = approximately 1 g

1 CLEANSE

- Remove as much loose debris from the wound as possible
- Gently cleanse the wound bed with sterile saline or an appropriate wound cleanser at least 45 minutes followed by saline, each time a dressing is changed
- When necessary, cross hatch thick eschar with a #10 blade to ensure optimal surface contact

2 APPLY

- Apply directly to the wound or to a sterile gauze pad, which is then applied to the wound and properly secured
- Apply SANTYL® Ointment at 3 mm thickness (approximately nickel thickness)
- Apply SANTYL® Ointment within the area of the wound
- Apply once daily or more frequently if the dressing becomes soaked, as from incontinence

3 COVER

- Wounds with sufficient exudate will naturally activate the collagenase enzyme, but a dry wound bed may require additional moisture
- Do not use dressings containing silver (Ag) or iodine (I2) with SANTYL® Ointment, as these ions inactivate collagenase, the active enzyme in SANTYL® Ointment

If infection develops:
- You may apply a topical antibiotic powder before applying SANTYL® Ointment
- If infection persists, discontinue use of SANTYL® Ointment until the infection is resolved

DESCRIPTION: Collagenase SANTYL® Ointment is a sterile enzymatic debriding ointment which contains 250 collagenase units per gram of white petrolatum USP. The enzyme collagenase is derived from the fermentation by Clostridium histolyticum. It possesses the unique ability to digest collagen in necrotic tissue.

CLINICAL PHARMACOLOGY: Since collagen accounts for 75% of the dry weight of skin tissue, the ability of collagenase to digest collagen in the physiological pH and temperature range makes it particularly effective in the removal of detritus. Collagenase thus contributes towards the formation of granulation tissue and subsequent epithelization of dermal ulcers and severely burned areas. Collagen in healthy tissue or in newly formed granulation tissue is not attacked. There is no information available on collagenase absorption through skin or its concentration in body fluids associated with therapeutic and/or toxic effects, degree of binding to plasma proteins, degree of uptake by a particular organ or in the fetus, and passage across the blood brain barrier.

INDICATIONS AND USAGE: Collagenase SANTYL® Ointment is indicated for debriding chronic dermal ulcers and severely burned areas.

CONTRAINDICATIONS: Collagenase SANTYL® Ointment is contraindicated in patients who have shown local or systemic hypersensitivity to collagenase.

PRECAUTIONS: The optimal pH range of collagenase is 6 to 8. Higher or lower pH conditions will decrease the enzyme's activity and appropriate precautions should be taken. The enzymatic activity is also adversely affected by certain detergents, and heavy metal ions such as mercury and silver which are used in some antiseptics. When it is suspected such materials have been used, the site should be carefully cleansed by repeated washings with normal saline before Collagenase SANTYL® Ointment is applied. Soaks containing metal ions or acidic solutions should be avoided because of the metal ion and low pH. Cleansing materials such as Dakin’s solution and normal saline are compatible with Collagenase SANTYL® Ointment.

Debilitated patients should be closely monitored for systemic bacterial infections because of the theoretical possibility that debriding enzymes may increase the risk of bacteremia.

ADVERSE REACTIONS: No allergic sensitivity or toxic reactions have been noted in clinical use when used as directed. However, one case of systemic manifestations due to overdose has been reported.

OVERDOSAGE: No systemic or local reaction attributed to overdose has been observed in clinical investigations and clinical use. If deemed necessary the enzyme may be inactivated by washing the area with povidone iodine.

DOSEAGE AND ADMINISTRATION: Collagenase SANTYL® Ointment should be applied once daily (or more frequently if the dressing becomes soiled, as from incontinence). When clinically indicated, crosshatching thick eschar with a #10 blade allows Collagenase SANTYL® Ointment more surface contact with necrotic debris. It is also desirable to remove, with forceps and scissors, as much loosened detritus as can be done readily. Use Collagenase SANTYL® Ointment in the following manner:

1 – Prior to application the wound should be cleansed of debris and digested material by gently rubbing with a gauze pad saturated with normal saline solution, or with the desired cleansing agent compatible with Collagenase SANTYL® Ointment (See PRECAUTIONS), followed by a normal saline solution rinse.

2 – Whenever infection is present, it is desirable to use an appropriate topical antibiotic powder. The antibiotic should be applied to the wound prior to the application of Collagenase SANTYL® Ointment. Should the infection not respond, therapy with Collagenase SANTYL® Ointment should be discontinued until remission of the infection.

3 – Collagenase SANTYL® Ointment may be applied directly to the wound or to a sterile gauze pad which is then applied to the wound and properly secured.

4 – Use of Collagenase SANTYL® Ointment should be terminated when debridement of necrotic tissue is complete and granulation tissue is well established.

HOW SUPPLIED: Collagenase SANTYL® Ointment contains 250 units of collagenase enzyme per gram of white petrolatum USP.

Do not store above 25°C (77°F). Sterility guaranteed until tube is opened.

Collagenase SANTYL® Ointment is available in 15 gram, 30 gram, and 90 gram tubes.
